

Actiferol drops

Dietary supplement

Oral suspension.

Product for infants, children and adults.

Iron is a microelement required for proper development and functioning of body. It contributes to proper development of cognitive functions in children. It contributes to the proper creation of hemoglobin and red cells which is really important for the growing body of a child. It helps in proper functioning of immunity system. It is an ingredient of hemoglobin which conditions transport of oxygen.

Actiferol Fe[®] contains unique form of iron put under micronization and emulgation. Thanks to micronization, i.e. great fragmentation, absorption of iron from iron pyrophosphate (III) is twice as high which is confirmed by researches. Iron contained in Actiferol Fe[®] is liberated in intestines, not in stomach. Thanks to that, there are no afflictions connected with digestive system.

Varied diet and healthy lifestyle are important to stay healthy.
